AB A possible connection between septation/division and induction of cloned  
ampC .beta.-lactamase was investigated. When a ftsZ84(Ts) mutant of  
Escherichia coli carrying ampR-ampC from Citrobacter freundii was grown at  
the restrictive temperature (42.degree. C), induction of .beta.-lactamase  
by cefoxitin was inhibited by about 80%. Inhibition was virtually complete  
when a ftsZ84(Ts) mutant of different genetic background was tested.  
Although somewhat delayed, the induction of .beta.-lactamase in  
transformed ftsA(Ts) and ftsQ(Ts) mutants was similar to that observed in  
wild-type transformants. These results imply that **FtsZ** is  
involved in the process of .beta.-lactamase induction.
